# Responsible Machine Learning Zhao Rui

- A brief summary of the kaggle competition with some top submission will be released in the course website next week
- Looking forward to your distance group projects' work
- Do not touch your face when u debug (more important than wearing masks)

Frustrated programmer

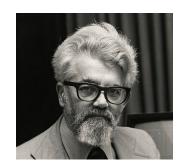

## Agenda

- 1. History of Al
- 2. Is ML Dangerous?
- 3. Accountable Algorithms
- 4. Course Summary

## History of Al

#### Birth of Al

1956: Workshop at Dartmouth College:

John McCarthy

Marvin Minsky

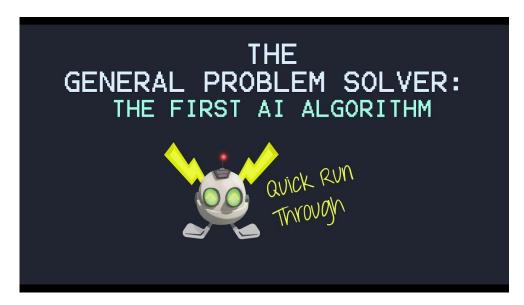

Claude Shannon

#### Targets:

 Every aspect of learning or any other feature of intelligence can be so precisely described that a machine can be made to simulate it.

#### Early Successes

 Newell & Simon's Logic Theorist: prove theorems in Principia Mathematica using search + heuristics; later General Problem Solver (GPS)

https://en.wikipedia.org/wiki/General Problem Solver

## Overwhelming Optimism

- 1958, H.A.Simon and Allen Newell: "within ten years a digital computer will be the world's chess champion" and "within ten years a digital computer will discover and prove an important new mathematical theorem".
- 1965, H.A.Simon: "machines will be capable, within twenty years, of doing any work a man can do"
- 1967, Marvin Minsky: "Within a generation...the problem of creating 'artificial intelligence" will substantially be solved"
- 1970, Marvin Minsky: "In from three to eight years we will have a machine with the general intelligence of an average human being".

## underwhelming results

Example: machine translation

The spirit is willing but the flesh is weak.

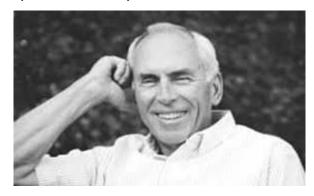

↓ (Russian) ↓

The vodka is good but the meat is rotten.

1966: ALPAC report cut off government funding for MT

## Al is overhyped...

 We tend to overestimate the effect of a technology in a short run and underestimate the effect in a long run.
 Roy Amara (1925-2007)

## Implications of Early Era

#### Problems:

- Limited computation: search space grew exponentially, outpacing hardware
- Limited information: complexity of AI problems (number of words, objects, concepts in the world)

#### Contributions

- Lisp, garbage collection, time-sharing (John MacCarthy)
- Key paradigm: separate modeling (declarative) and inference (procedural)

## Symbolic VS Connectionist Al

Vol. LIX. No. 236.]

October, 1950

#### MIND

A QUARTERLY REVIEW

OF

PSYCHOLOGY AND PHILOSOPHY

#### I.—COMPUTING MACHINERY AND INTELLIGENCE

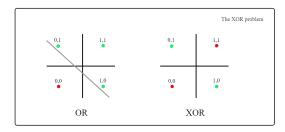

By A. M. TURING

#### 1. The Imitation Game.

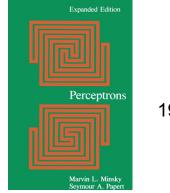

I PROPOSE to consider the question, 'Can machines think 'This should begin with definitions of the meaning of the terms 'machine' and 'think'. The definitions might be framed so as to reflect so far as possible the normal use of the words, but is attitude is dangerous. If the meaning of the words 'machine' and 'think' are to be found by examining how they are commonly used it is difficult to escape the conclusion that the meaning and the answer to the question, 'Can machines think' 'is one so that the same of the sam

The new form of the problem can be described in terms of a game which we call the 'imitation game'. It is played with three people, a man (A), a woman (B), and an interrogator (C) who may be of either sex. The interrogator says in a room spart from the other two. The object of the game for the interrogator is to determine which of the other two is the man and which is the woman. He knows them by labels X and Y, and at the end of the game he says either' X is A and Y is B 'or 'X is B and Y is A'. The interrogator is allowed to put questions to A and B

C: Will X please tell me the length of his or her hair? Now suppose X is actually A, then A must answer. It is A's

**Discouraging**: perceptrons can only represent linearly separated functions

1969

## Knowledge-based Systems (70-80s)

- Expert Systems: elicit specific domain knowledge from experts in form of rules:
  - If [premises] then [action]

Category	Problem addressed	Examples
Interpretation	Inferring situation descriptions from sensor data	Hearsay (speech recognition), PROSPECTOR
Prediction	Inferring likely consequences of given situations	Preterm Birth Risk Assessment <sup>[56]</sup>
Diagnosis	Inferring system malfunctions from observables	CADUCEUS, MYCIN, PUFF, Mistral, [57] Eydenet, [58] Kaleidos [59]
Design	Configuring objects under constraints	Dendral, Mortgage Loan Advisor, R1 (DEC VAX Configuration), SID (DEC VAX 9000 CPU)
Planning	Designing actions	Mission Planning for Autonomous Underwater Vehicle <sup>[60]</sup>
Monitoring	Comparing observations to plan vulnerabilities	REACTOR <sup>[61]</sup>
Debugging	Providing incremental solutions for complex problems	SAINT, MATHLAB, MACSYMA
Repair	Executing a plan to administer a prescribed remedy	Toxic Spill Crisis Management
Instruction	Diagnosing, assessing, and repairing student behavior	SMH.PAL, <sup>[62]</sup> Intelligent Clinical Training, <sup>[63]</sup> STEAMER <sup>[64]</sup>
Control	Interpreting, predicting, repairing, and monitoring system behaviors	Real Time Process Control, [65] Space Shuttle Mission Control [66]

## Knowledge-based Systems

- Contributions:
  - First real application that impacted industry
  - Knowledge helped curb the exponential growth

- Problems:
  - Knowledge is not deterministic rules, need to model uncertainty
  - o Requires considerable human efforts to create rules, hard to maintain.

## Modern AI (90s-present)

• Stat Model: Pearl (1988) promote Bayesian networks in AI to model uncertainty (based on Bayes rule from 1700)

**Stat Model:** infer the relationship among variable in data

 Machine Learning: Vapnik (1955) invented support vector machines to learn parameters (based on statistical models in early 1900s)

Machine Learning: sacrifice interpretability for predictive power

#### Take Linear Regression as the example

#### **Stat Model:**

- 1.**Inference**: Characterize the relationship between the smoking index and cancer rates.
- 2. Conduct the significance test of the model parameters

#### ML:

#### 1.Prediction:

Get a model that is able to make prediction of the cancer rates based on smoking index

2. Evaluate the model performance over testing data.

## The Second Machine Age

- Al is being used to make decisions for:
  - Credit
  - Education
  - Employment
  - Advertising
  - Healthcare
  - Policing
  - Urban Computing
  - 0

# Is Machine Learning Dangerous?

#### Elon Musk: Humanity Is a Kind of 'Biological Boot Loader' for Al

Al is outpacing our ability to understand it, the Tesla CEO says. It will open a new chapter for society, replies the Alibaba cofounder.

Jack Ma, left, debates Al-and the future of humanity-with Elon Musk ALY SONG/REUTERS

#### **WOMAN SAYS AMAZON'S ALEXA TOLD HER TO** STAB HERSELF IN THE HEART FOR 'THE **GREATER GOOD'**

BY JAMES CROWLEY ON 12/24/19 AT 12:04 PM EST

## Is Machine Learning Dangerous?

- Will human be ruled by machines?
  - It seems unlikely any time.
  - General AI is so challenging
  - Algorithms are not "intelligent" enough
- But machine learning can potentially be misused, misleading, and/or invasive
  - Important to think about implications of what you build

#### Nicolas Kayser-Bril @nicolaskb · Mar 31

Black person with hand-held thermometer = firearm.
Asian person with hand-held thermometer = electronic device.

Computer vision is so utterly broken it should probably be started over from scratch.

Faces Objects Labels Web Properties Safe Search

Gun 88%

Photography 68%

Firearm 65%

Plant 59%

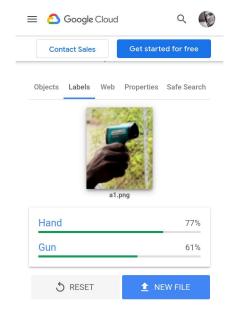

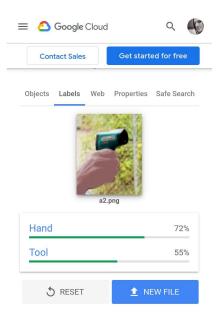

Technology	68%
Electronic Device	66%
Photography	62%
Mobile Phone	54%

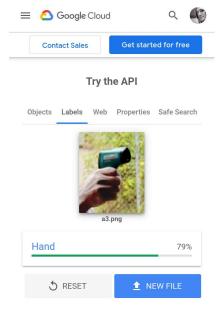

Replying to @nicolaskb

I cropped the first photo to just the hand and device, and did some very inexpert colour tweaks in an attempt to make the skin white, and somewhere in between. The results are troubling.

#### Screenshots iPhone iPad

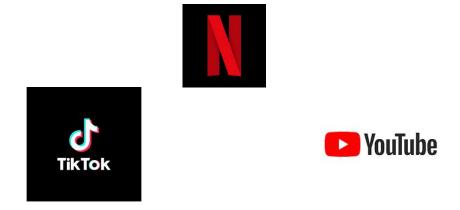

## **Optimization Targets**

Is the objective function of ML algorithms also good for human well-being?

## Accountable Algorithms

#### Fairness

Black people with complex medical needs were less likely than equally ill white people to be referred to programmes that provide more personalized care. Credit: Ed Kashi/VII/Redux/eyevine

An algorithm widely used in US hospitals to allocate health care to patients has been systematically discriminating against black people, a sweeping analysis has found.

#### **Fairness**

Suppose your classifier gets 90% accuracy...

#### Scenario 1:

#### Scenario 2:

## Why unfair?

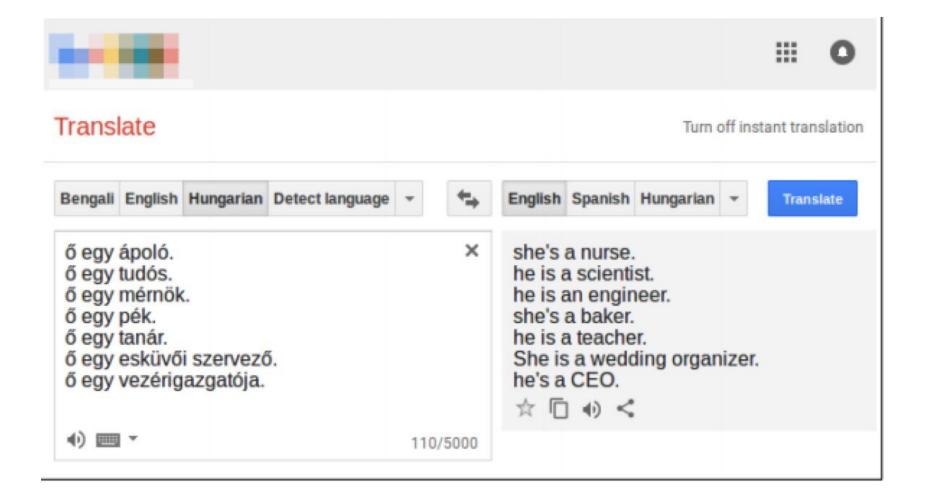

- How does this type of error happen?
  - Most ml models' objectives will sacrifice the accuracy of the minority groups to make accurate predictions for majority class.

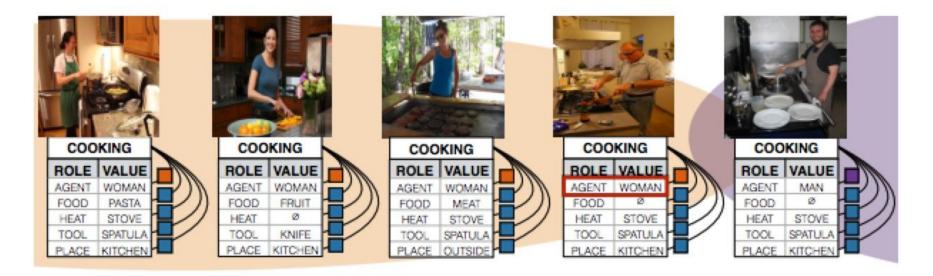

- Possibilities:
  - Not enough diversity in training data
  - Not enough diversity in test data
  - Not enough error analysis

#### Bias

• Bias and stereotypes that exist in data will be learned by ML algorithms

• Sometime, those biases will be amplified by ML

- Training data:
  - Women appeared in "cooking" images 33% more often than men
- Predictions:
  - Women appeared 68% more often

## Privacy

Training data is often scraped from the web

- Personal data may get scooped up by ML systems
  - o Are users aware of this?
  - How do they feel about it?
- No reveal sensitive information (income, health, communication)

MegaFace Dataset: 4.7 million photos of 627,000 individuals, from Flickr users

#### Use and Misuse

- Machine learning can predict:
  - If you are overweight
  - If you are transgender
  - If you have died

 People may build these classifiers for legitimate purposes, but could easily be misused by others

## **Criminal Machine Learning**

- Can we predict if someone is prone to committing a crime based on their facial structure?
- One of studies: Wu and Zhang (2016), "Automated Inference on Criminality using Face Images", claims yes, with 90% accuracy.
- Good summary of why the answer is probably no:
  - O <a href="https://callingbullshit.org/case">https://callingbullshit.org/case</a> studies/case study criminal machine learning.html

(a) Three samples in criminal ID photo set  $S_c$ .

(b) Three samples in non-criminal ID photo set  $S_n$ 

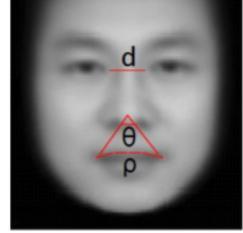

Figure 2. Criminal and non-criminal faces from Wu and Zhang (2016)

#### Use and Misuse

- How was the dataset created?
  - Criminal photos: government IDs
  - Non-criminal photos: professional headshots
- What did the classifier learn?

"The algorithm finds that criminals have shorted distances between the inner corners of the eyes, smaller angles between the nose and the corners of the

mouth, and higher curvature of the upper lip."

## **FAT Machine Learning**

- Statement from Fairness, Accountability, and Transparency in Machine Learning organization
  - https://www.fatml.org/resources/principles-for-accountable-algorithms

Algorithms and the data that drive them are designed and created by people -- There is always a human ultimately responsible for decisions made or informed by an algorithm. "The algorithm did it" is not an acceptable excuse if algorithmic systems make mistakes or have undesired consequences, including from machine-learning processes.

## General Principle

- If your tool seems dystopian:
  - Consider whether this is really something you should be building...
    - One argument: someone will eventually build this technology, so better for researchers to do it first to understand it.
    - Still, proceed carefully: understand potential misuse
  - Be sure that your claims are correct
    - Solid error analysis is critical
    - Misuse of an inaccurate system even worse than misuses of an accurate system.

# **Course Summary**

Quant investing (+ Add to myFT)

#### Glitchy coronavirus markets cause quant funds to misfire

Renaissance, Two Sigma and DE Shaw suffer unusual setbacks

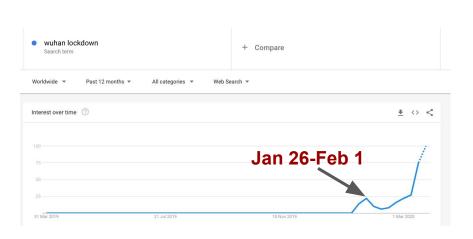

## Overfitting

- The common practice in quant research: after conducting **hundreds** or even thousands times backtesting, the best strategy (highest sharpe ratio) is selected.
  - Selection bias
  - Testing data or out-of-sampled data is misused as validation data
  - Overfitting!!!
- In hypothesis test, the testing is used to refute a false claim instead of building a claim
- Explainability matters (Try to build theories, not a complex and black box)

#### **Prediction**

- Sell-off is the black swan to Quant models based on history prices or fundamental data or cross-sectional factors
  - The future trend is unpredictable
- However, it is possible to find hidden states behind huge amounts of unstructured data
  - How to filter noise (statistical hypothesis testing)

#### JD launches intelligent breeding program with pig face recognition features

CKN (§ November 21, 2018 (© 2,892

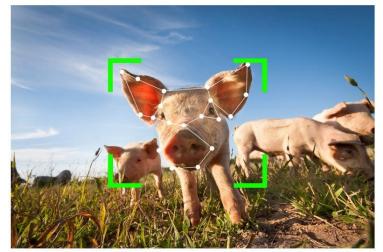

Photo illustration by Slate. Photo by Getty Images Plus.

Given the face recognition technology for pigs, which sector may show **the least** interest?

A Livestock farms

**B** Government

C Insurance Company

## Basic Paradigm

- Define the Tasks (what should be learned)
- Find the training Experiences(datasets)
- Quantify the Performance via a measure
- Choose a machine learning model to complete the T and improve the P via the
